

# Adaptation of forests to climate change

## An innovative digital tool for Bavaria (Germany)

Steffen Taeger

Wolfgang Falk, Karl H. Mellert, Josefine Beck, Elke Dietz, Christian Kölling

# **Adaptation of forests to climate change**

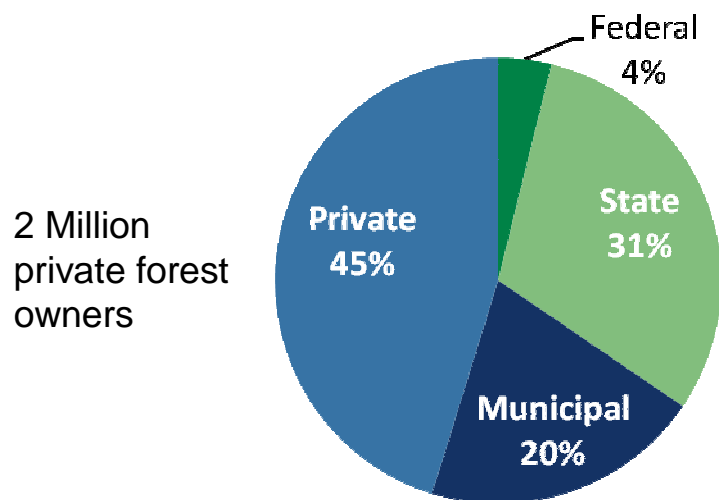

## **An innovative digital tool for Bavaria (Germany)**

- 1. Forests and forest adaptation in Germany**
- 2. The Bavarian way**
- 3. Development of a cultivation risk model**
- 4. Implementation of a cultivation risk model**  
**→ Forest GIS**

# German forests

(data: NFI 2001/2002)

- Germany: 11.1 Mio ha forest land (31%)

Bavaria: 2.6 Mio ha forest land  
69 % Conifers (45% Picea abies!)  
average size of private forest property: **2 ha**

# Forest adaptation in Germany

National level: providing a framework –general recommendations

- „DAS“ - German adaptation strategy 2008 / 2011 (BMUB 2012)

- Forest strategy 2020 (BMELV 2011)

- Forests will be negatively affected by dry periods, warmer temperatures, pest infestations
- Adaptation measures should be taken:  
Mixed forests with Site-adapted tree species

**Federal structure:  
Federal states responsible!**

BaSIS – an innovative tool for Bavaria

# Forest adaptation in Germany

Federal states

- Assessment of threats due to climate change and possible adaptation responses similar, but
- Diverse strategies of adaptation measures are implemented

Two groups:

## **P Proactive substitution**

Forest transformation / conversion by replacing sensitive tree species

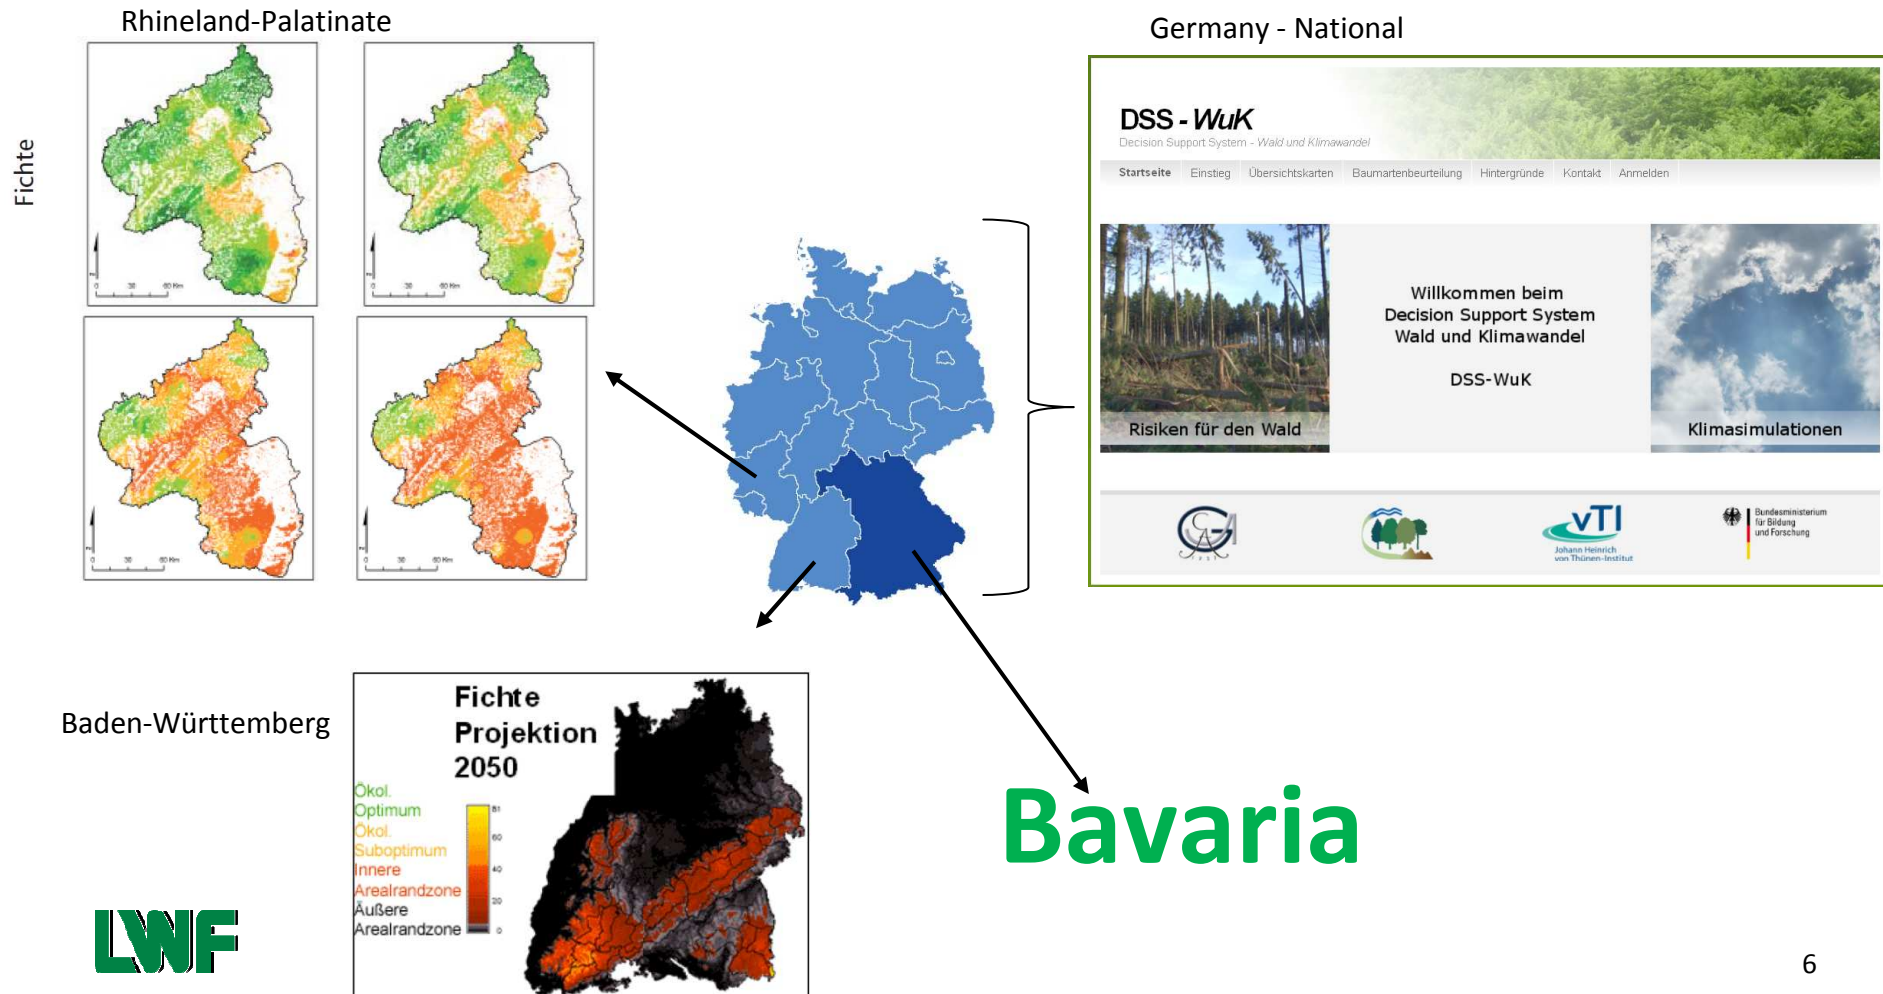

## **Stabilization**

Risk minimizing by management close to nature / mixed forests

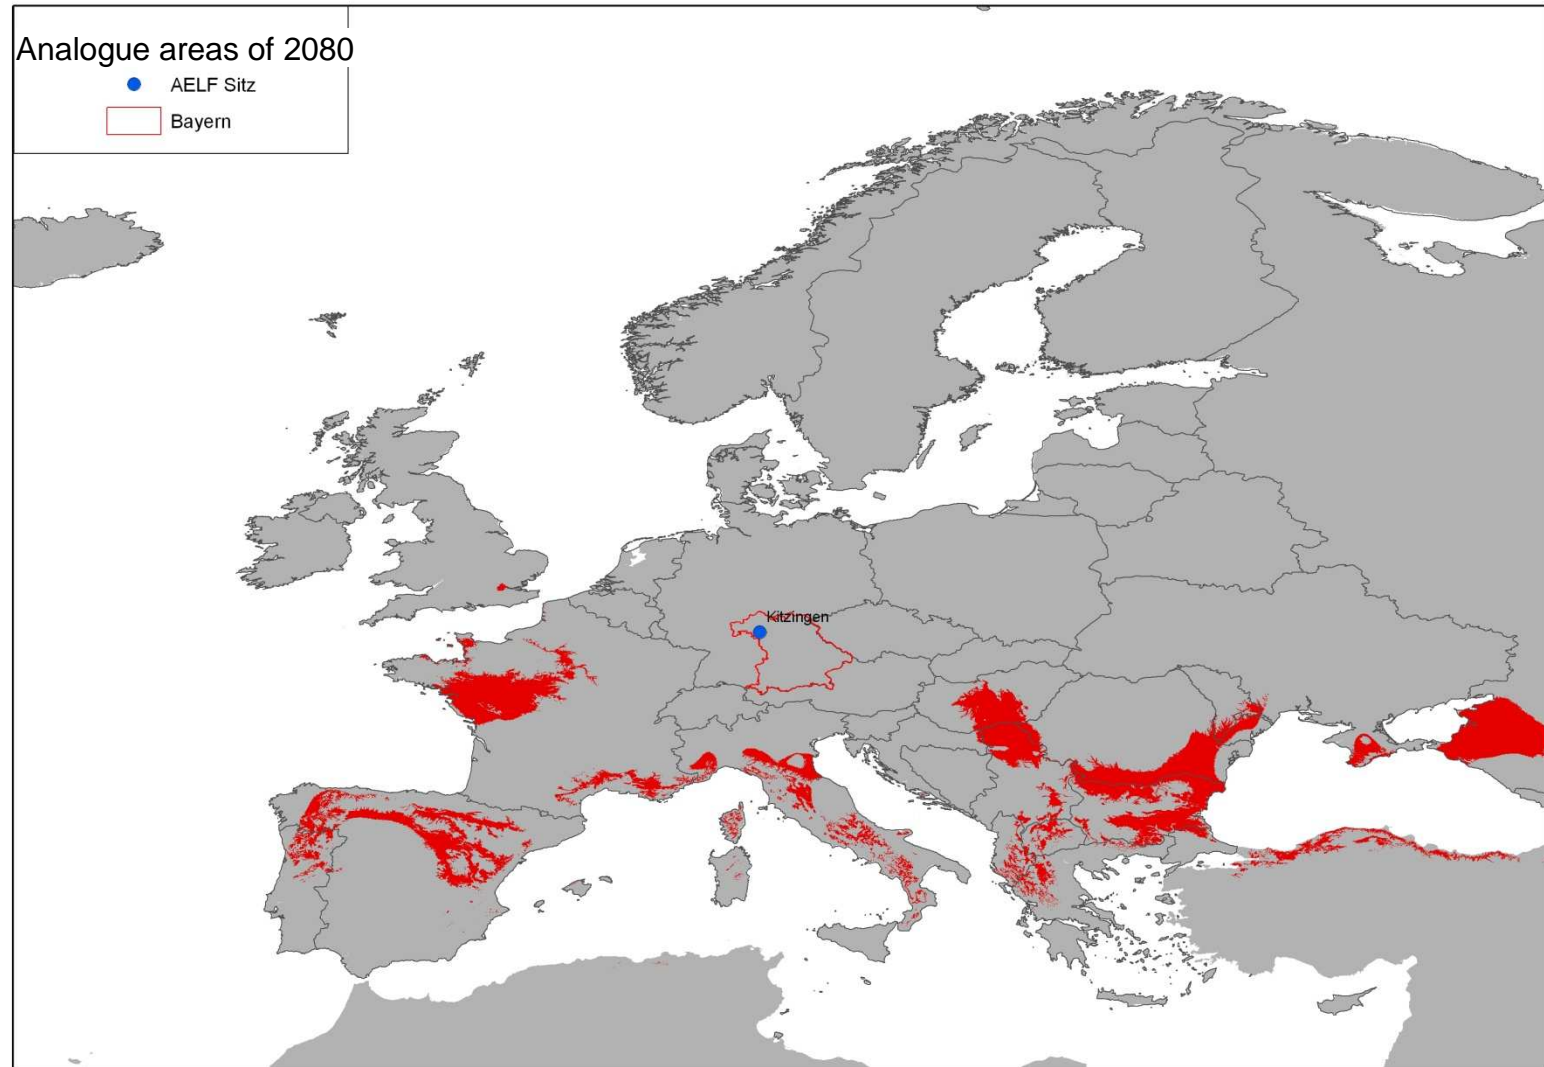

# Forest adaptation in Germany

- Several approaches to assess species risk, e.g. :

- 
1. Forests and forest adaptation in Germany
  2. **The Bavarian way**
  3. Development of a cultivation risk model
  4. Implementation of a cultivation risk model  
→ Forest GIS

# Bavarian climate of the future analogue to ...

# Possible impacts

- Tolerance level of species is / could be exceeded

Spruce in Bavaria

Ammer et al. (2006) LWF Wissen 54

Pine in Valais (Switzerland)

Rigling et al. (2006) WSL-Merkblatt

Beech in Spain

Peñuelas, J., Boada, M. (2003)  
Global Change Biology 9 (2), 131-140

# Adaptation - Forest Conversion

# Funding by the Bavarian State

## Focus of adaptation measures

## „Bavarian climate concept“

## ■ Research

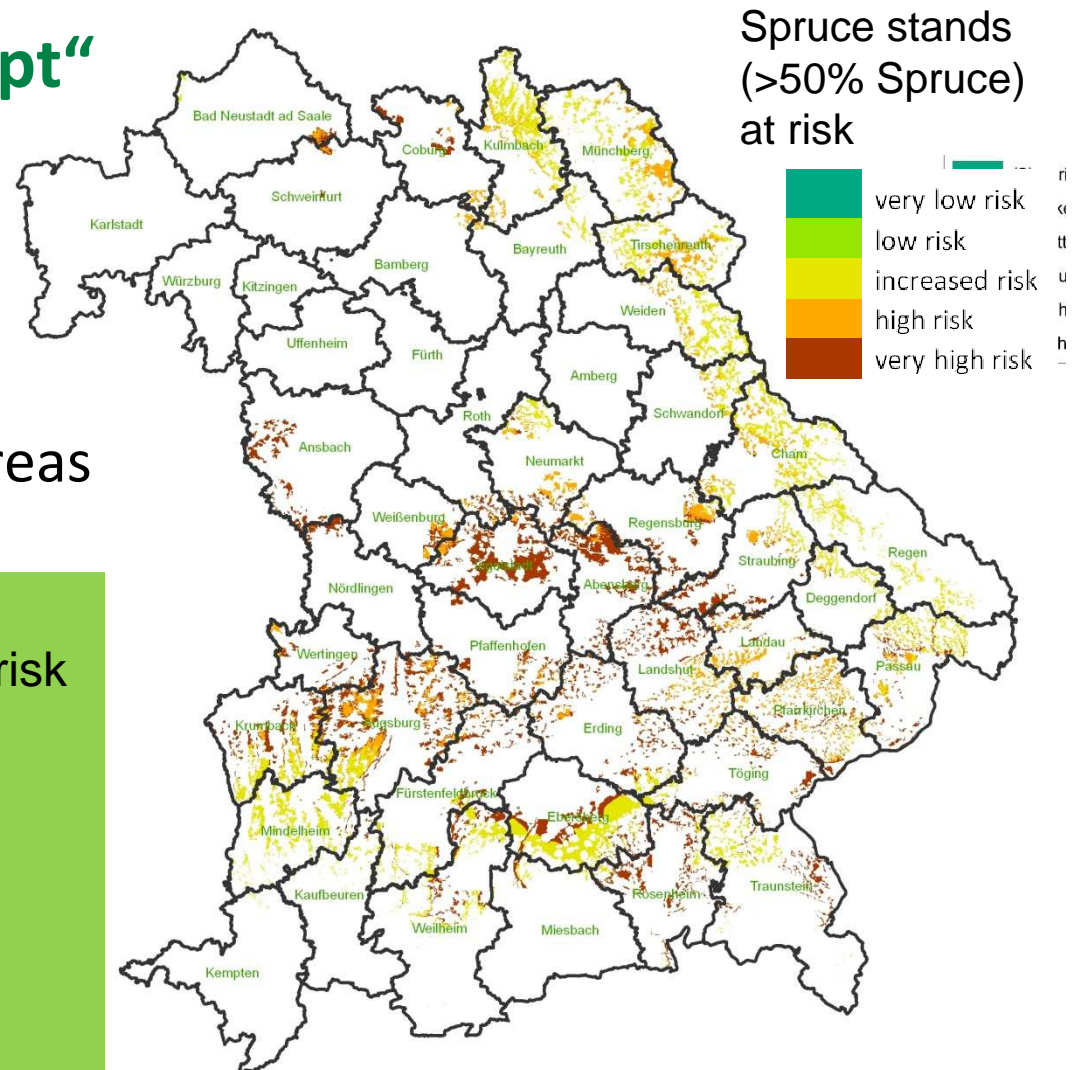

## ■ Forest adaptation

- Conversion
- Focus areas → project areas

Private / municipal forests:  
260.000 ha Spruce stands at urgent risk

Adaptation:  
Transformation of  
100.000 ha until 2020  
→ adapted mixed forests

Annually granted funding: 7 Mio. €

- 
1. Forests and forest adaptation in Germany
  2. The Bavarian way
  3. **Development of a cultivation risk model**
  4. Implementation of a cultivation risk model  
→ Forest GIS

# Development of GIS tool for Bavaria

## 1. Cultivation risk model

- Data:
  - European Level I data (ICP Forests), Bavarian NFI data (BWI<sup>2</sup>)
  - Climate data for Europe (WorldClim, Hijmans et al. 2005)
  - Climate, terrain and soil data for Bavaria
- Methods: **Species distribution models**  
(relationship between species distribution and environmental parameters)
- Modelling technique: Generalized Additive Models

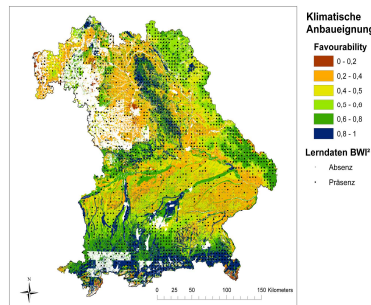

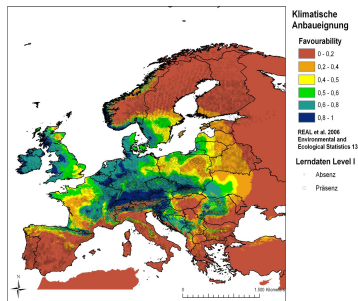

# Development of cultivation risk model

## Species distribution models

**European model**  
(distribution incl. margins)

**Bavarian model**  
including soil information

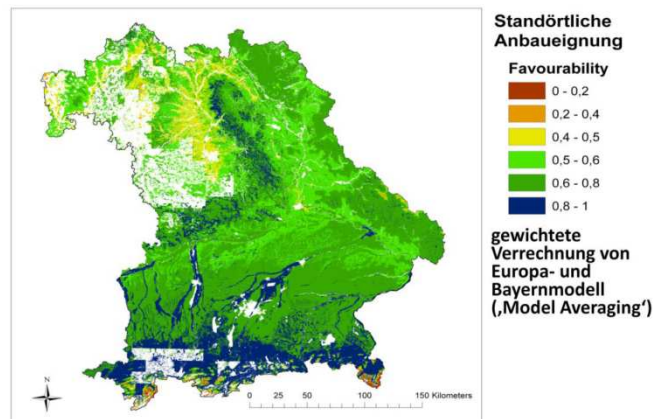

T May-Aug  
T Jan  
PPT

including:  
**Soil information**

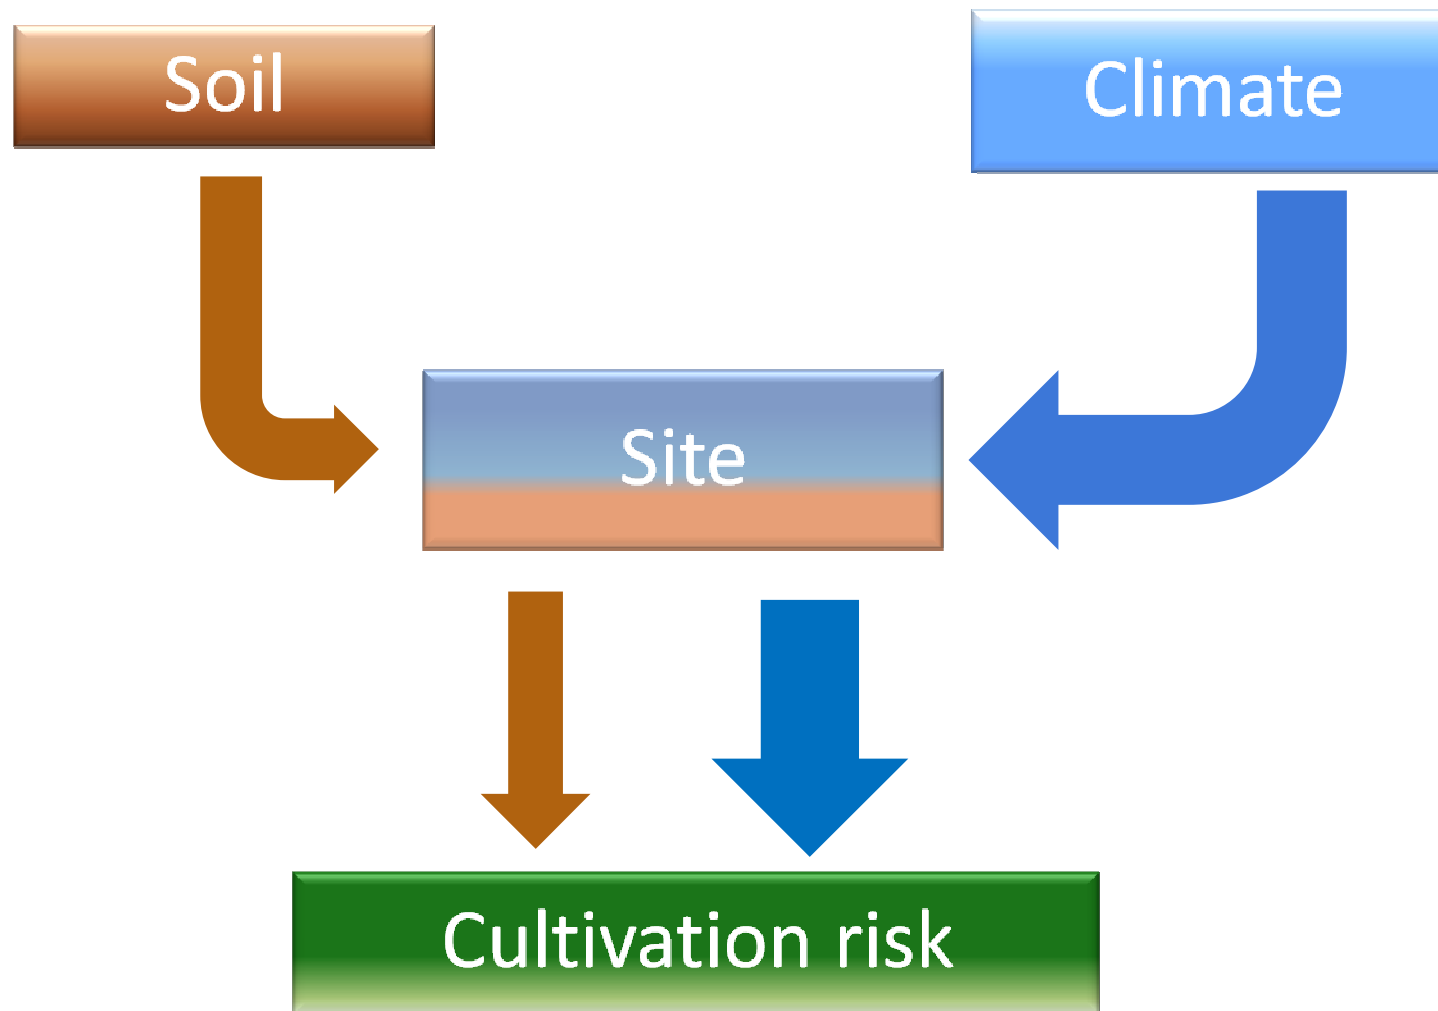

**intersection**

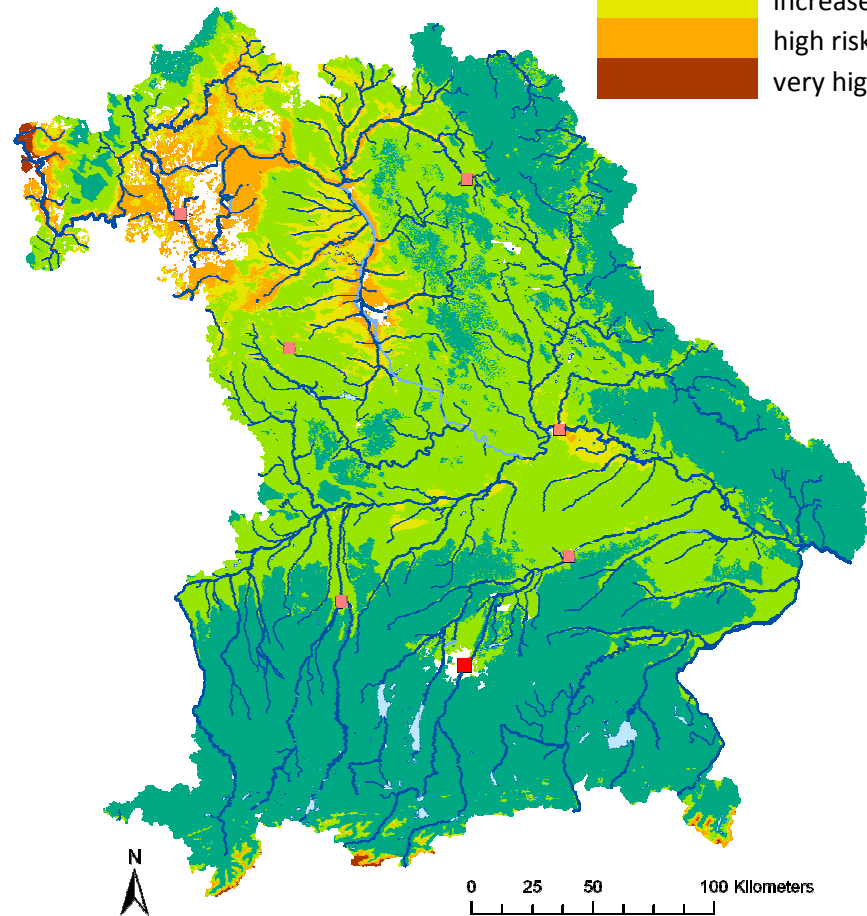

**Patches of  
special local  
soil conditions**

# Development of cultivation risk model

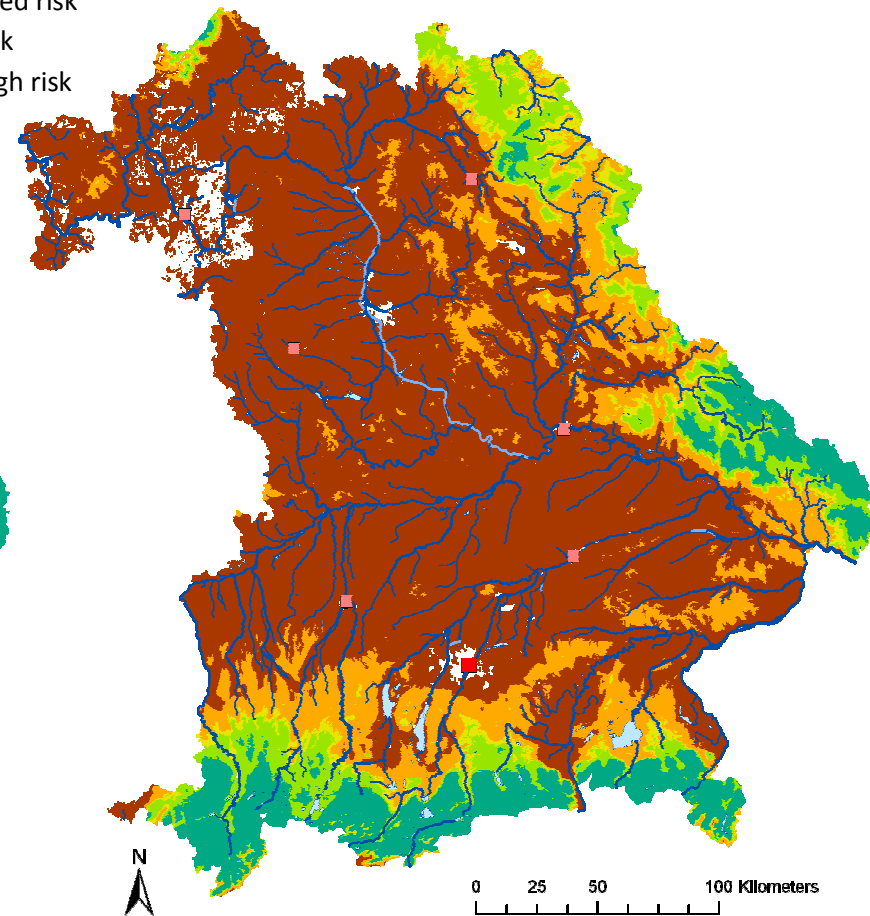

# Forest GIS - BaSIS

Spruce 1951-2000

2071-2100 WETTREG SRES B1

# Development of GIS tool for Bavaria

## 1. Cultivation risk model

### ■ Data:

- European Level I data (ICP Forests), Bavarian NFI data (BWI<sup>2</sup>)
- Climate data for Europe (WorldClim, Hijmans et al. 2005)
- Climate, terrain and soil data for Bavaria

### ■ Methods: **Species distribution models**

(relationship between species distribution and environmental parameters)

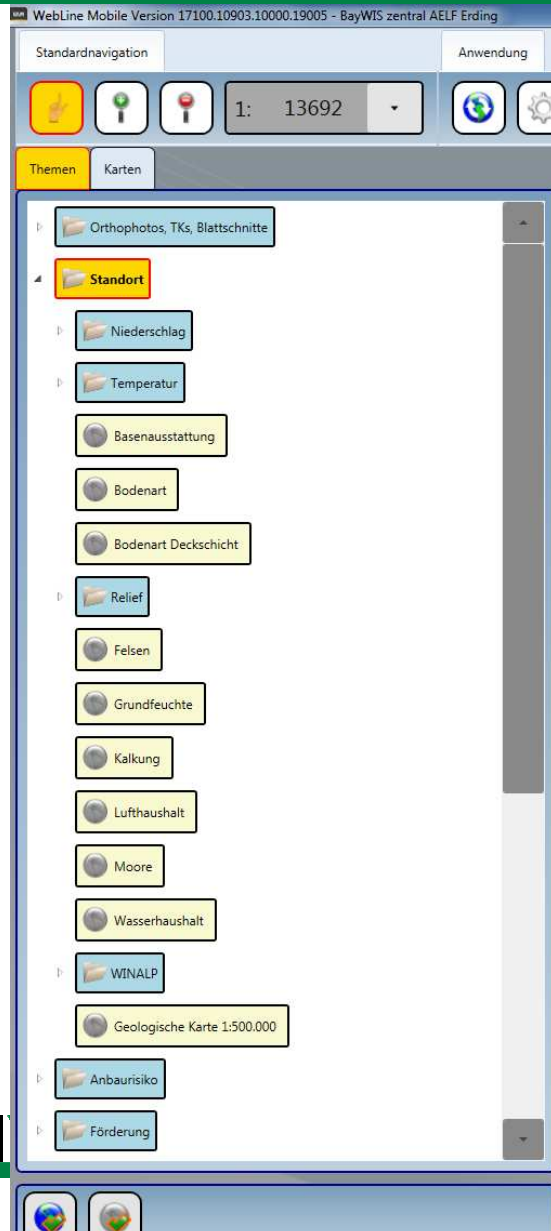

## 2. Digital site-information system (soil, climate, terrain) covering all forest areas in Bavaria

## 3. Forest GIS for the forestry administration: “BaSIS”

→ integration of all forestry data (e.g. ownership, protected areas...)

- 
1. Forests and forest adaptation in Germany
  2. The Bavarian way
  3. Development of a cultivation risk model
  4. **Implementation of a cultivation risk model**  
→ **Forest GIS**

# Forest GIS: BaSIS – site information

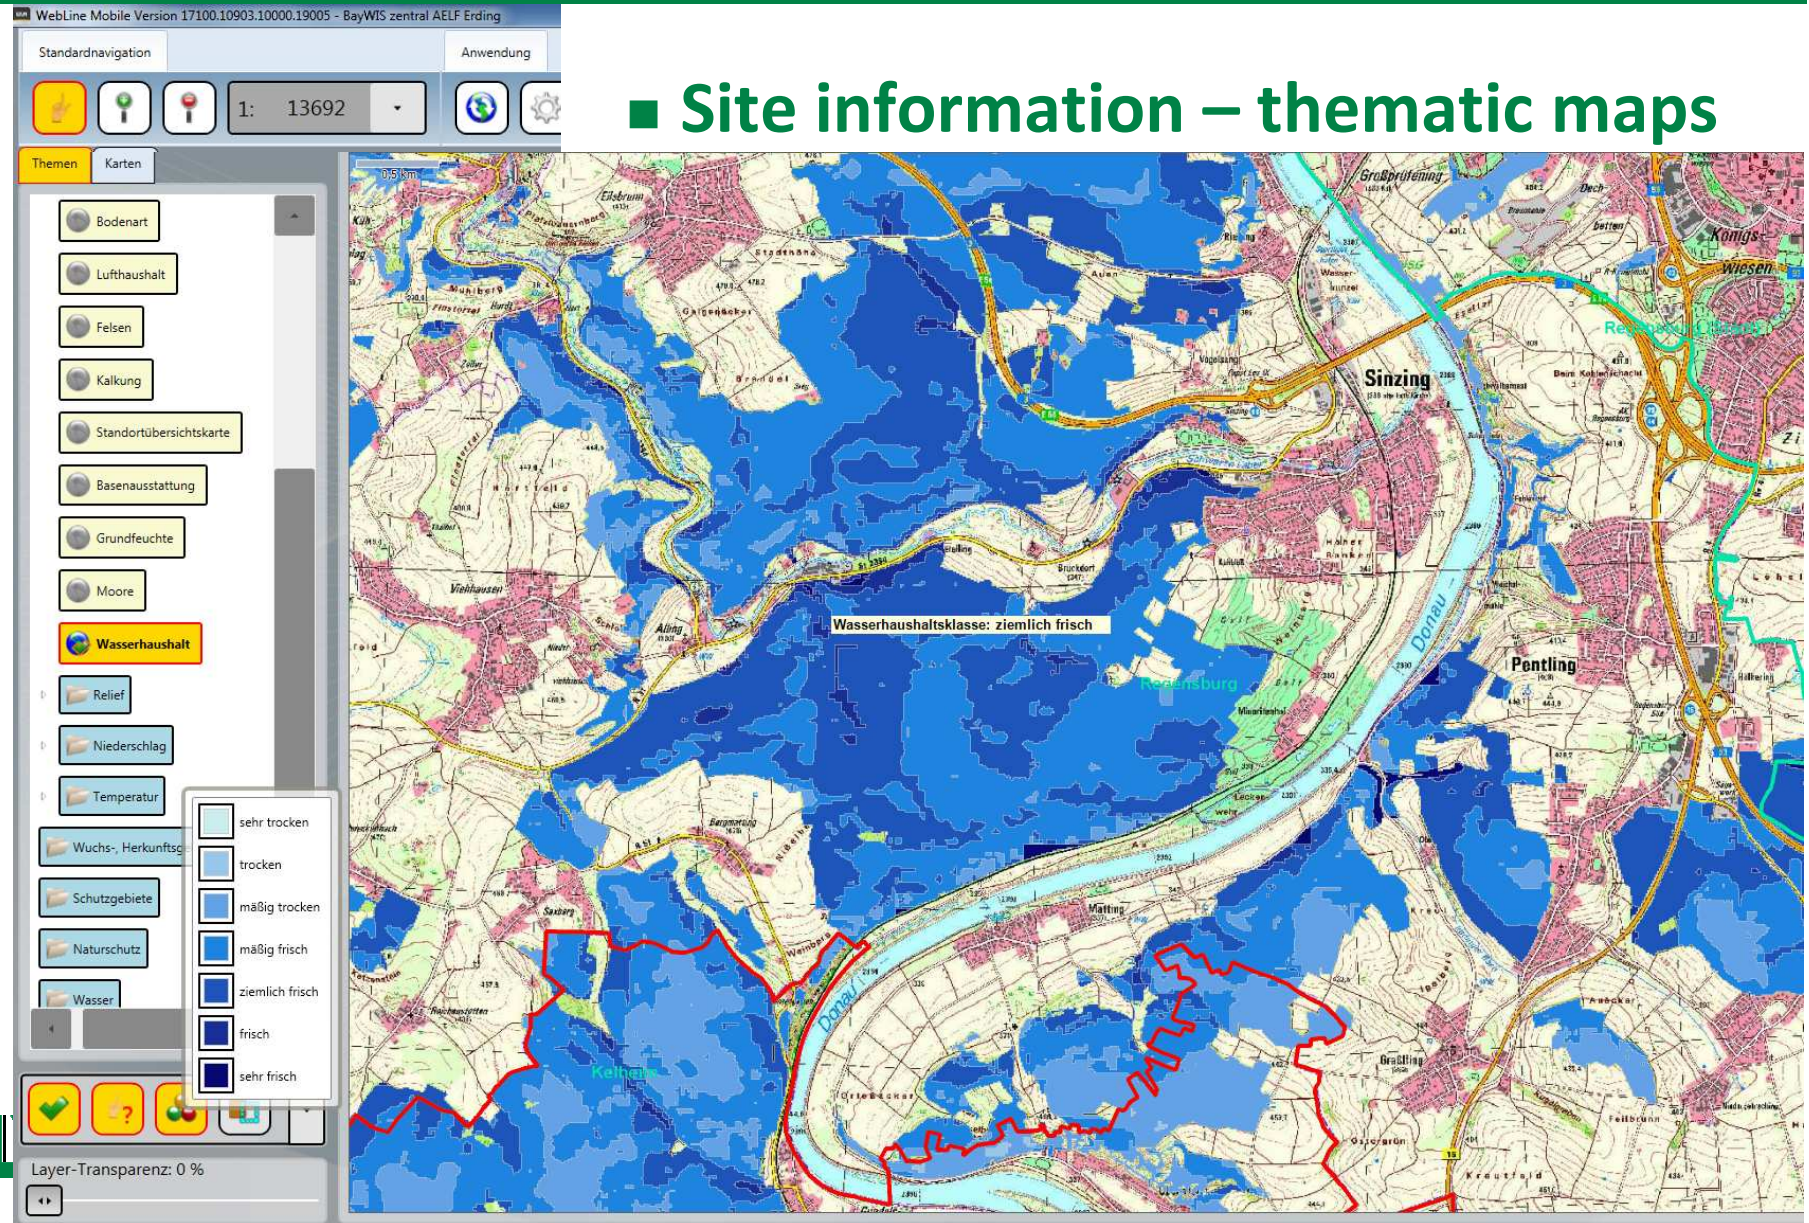

## ■ Site information – thematic maps

- Temperature
- Precipitation
- Rocks
- Soil type, soil texture
- Soil chemistry
- Water balance
- Aeration of soil (gley, pseudogley)

# Forest GIS: BaSIS – site information

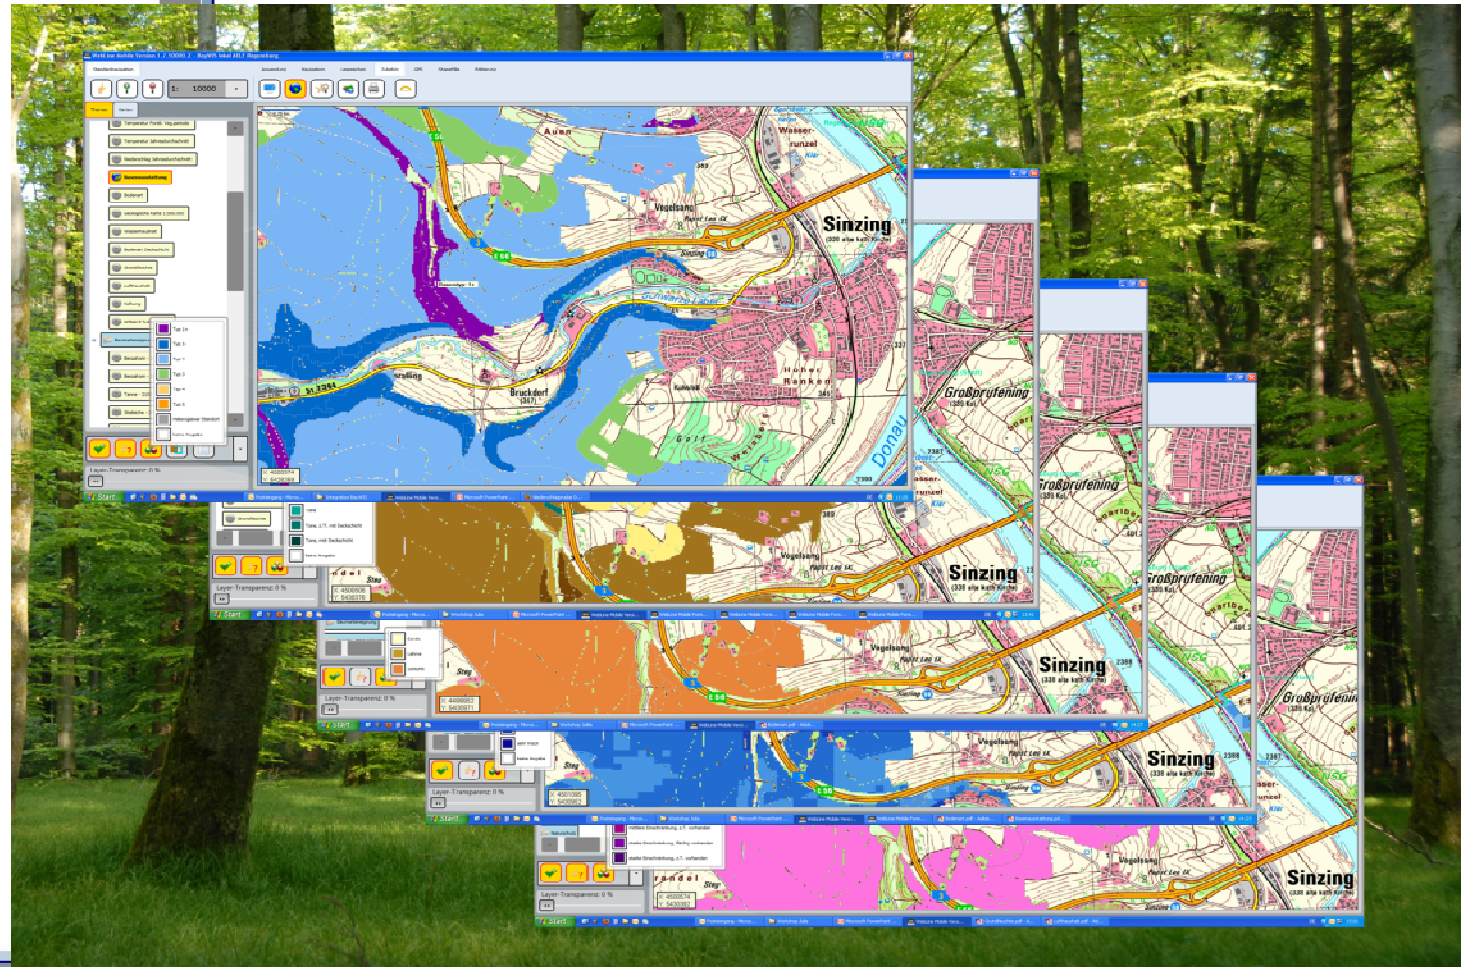

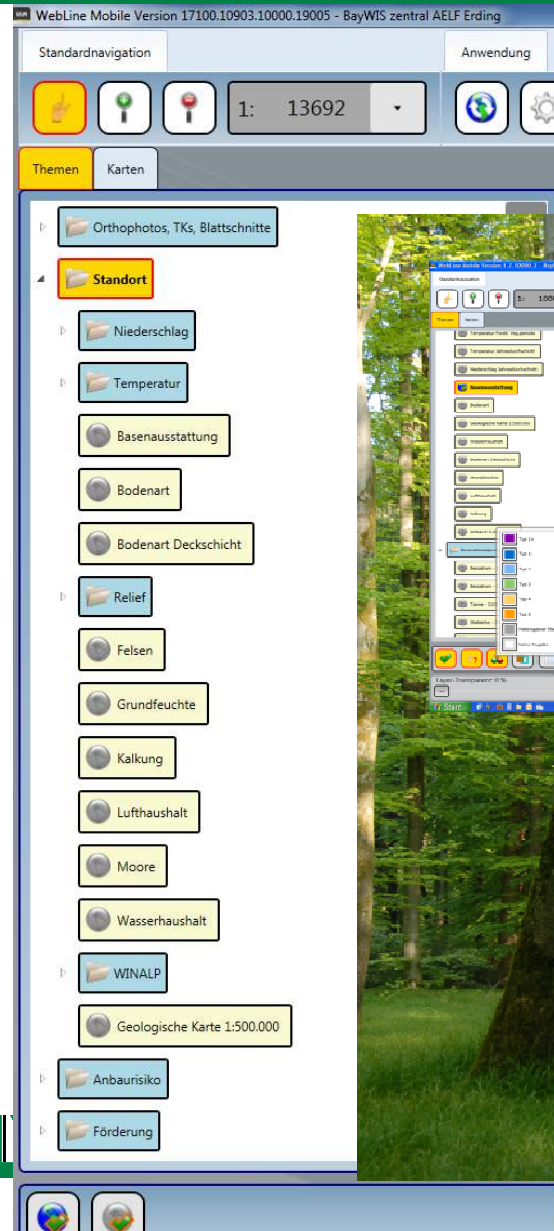

## ■ Site information – thematic maps

# Forest GIS: BaSIS – site information

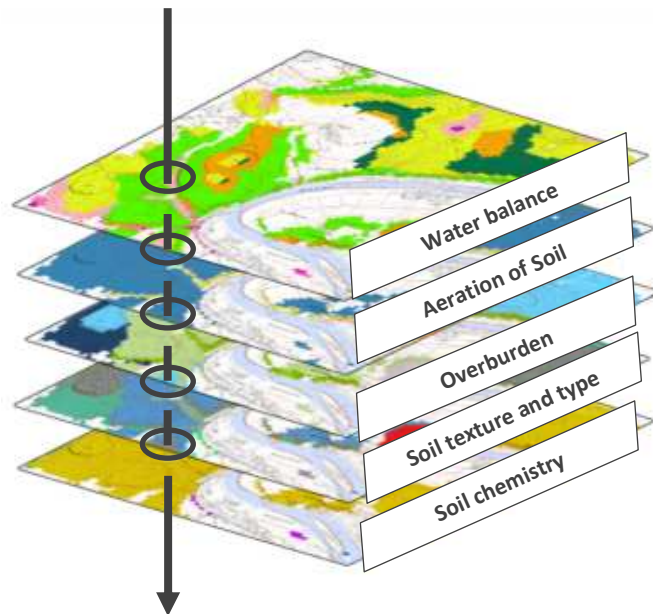

## ■ Site information – thematic maps

# Forest GIS: BaSIS – site information

## Point information

Soil properties  
Soil chemistry  
Water balance

# Forest GIS: BaSIS – cultivation risk

# Forest GIS: BaSIS – cultivation risk

## Point information

- Condensed point information: overview over the risk assessment of 21 tree species within the system

# Forest GIS: BaSIS – cultivation risk

- Condensed point information: overview over the risk assessment of 21 tree species within the system

# Forest GIS: BaSIS

- Complex system for forest experts
- Incorporated scientific knowledge - state of the art
- Dynamic, learning system  
→ updates
- Transparent rules
- **Basis of forest consulting**

# Forest GIS - BaSIS

All problems solved?

Implementation and adaptation – a fast selling item?

## ■ Level of acceptance?

- Climate scenarios
- Consequences for tree species
- Own experience – will become void / outdated
- new tools – traditional forestry

We have to reduce uncertainties

scientific basis → foresters, forest owners

# Conclusions and outlook

- Global warming impacts German / Bavarian forest ecosystems  
→ tolerance levels of tree species may be exceeded
- Bavaria, as several other federal states started adaptation measures and promotes the conversion of single species stands at high risk
- Tool - based on SDM to support the choice of tree species
- Our tool will be developed further
  - integration of climate data ensembles
  - Improvement of tolerance levels of species (MARGINS-project)
  - Integrate growth potential and combine it with cultivation risk
- But: decision is up to the forest owner

A close-up photograph of a single, vibrant green maple leaf. The leaf is positioned diagonally, with its stem extending towards the upper left. The leaf's surface is highly detailed, showing a complex network of veins. The edges of the leaf are serrated. The background is a soft, out-of-focus blur of dark green foliage and a hint of blue sky, suggesting a natural outdoor setting. The lighting is bright, highlighting the leaf's texture and color.

**Thank you!**
